

## DI-AMMONIUM PHOSPHATE

DAP is a granulated, high analysis compound fertiliser containing nitrogen, phosphorus and sulphur in every granule.

DAP is an ideal starter fertiliser used when planting cereals, grain legumes, oilseeds and a range of forage crops. It is one of the most widely used fertilisers and is best suited as a dry blend base for all crops and pastures requiring nitrogen and phosphorus.

DAP offers flexibility in application and can be applied through a spreader [pasture application] or an air-seeder [cropping].

DAP has excellent handling and storage properties.
