

MONO-AMMONIUM PHOSPHATE

MAP is an important granulated, high analysis compound fertiliser containing nitrogen, phosphorus and sulphur in every granule.

MAP is a water soluble fertiliser and dissolves readily when applied to moist soils. It is ideal for planting of cereals, grain legumes, oilseeds and a range of forage crops. It is one of the most widely used fertilisers and is best suited as a dry blend base for all crops and pastures requiring nitrogen and phosphorus.

MAP offers flexibility in application and can be applied through a spreader [pasture application] or an air-seeder [cropping].

MAP has excellent handling and storage properties.
