## MURIATE OF POTASH

MOP is a granular source of Potassium in the form of Potassium Chloride. The product contains large amounts of Potassium which makes the plant resistant to various diseases by promoting thickness of the outer cell walls.

MOP is essential to plant growth as it replenishes the natural levels of Potassium in soils which is lowered by root crops such as potatoes. It is ideal for use in crops with a high demand for Potassium, and pastures grown for forage and hay.

It should be noted that MOP and SOP are not necessarily interchangeable. Agronomic advice should be sought as to the suitability of either product as a perfect source of Potassium.
