

N-hibit Urea

N-hibit is Urea treated with a urease inhibitor formulation containing N – (butyl) thiophosphoric triamide (NBPT) that reduces ammonia volatilisation once applied. N-hibit Urea allows flexible application timing and increased efficiency of applied Nitrogen.

The active ingredient applied (NBPT) minimises urease enzyme activity which slows the conversion of urea to ammonia gas. It can extend the conversion period significantly depending on conditions and rate applied.

N-hibit Urea is treated at 1.5L 26.5% NBPT per tonne.
