

Sulphate of Ammonia

Fertiglobe Australia's premium granular ammonium sulphate fertiliser, containing Nitrogen and Sulphur. The Nitrogen contained is in the ammonium form, creating a strong bond with organic matter in the soil, stopping volatilisation. The sulphur in SOA is sulphate sulphur providing immediate availability to the plants.

SOA can be used as a stand-alone product or commonly used to create unique blends suitable across a range of pasture and cropping situations. SOA is commonly used in Canola, which has a particularly high demand for sulphur.

SOA provides flexibility and is used at both sowing with planting fertilisers or at topdressing with urea.
