

## SINGLE SUPERPHOSPHATE

SSP was the first available commercial phosphate fertiliser and is an excellent source of three important nutrients; Phosphorus [P], Calcium [Ca] and Sulphur [S].

SSP is a low analysis granular fertiliser, ideal for pasture production in Australia. It is commonly blended with [Muriate of Potash] MOP or [Sulphate of Potash] SOP to deliver much needed Potassium.

It is not uncommon to add trace elements to SSP before spreading. Molybdenum and copper, both important for pasture production, are common trace elements used as either a spray [liquid application] or granular blend.

SSP is generally a hard granule that can be stored for extended periods of time without absorbing moisture.
